```
/*
Topic- String buffer
Q16 Create a class called MyString : Declare two string type variables: str1 (" Welcome to Java
tutorial")   and str2("Todays topic is String Handling in Java"). Perform following operations in
this class:
        Concatenate two strings

        Covert str1 into lower case

        Covert str2 into upper case

        */

        package assignment1;

        public class StringBuffer {

        public static void main(String[] args)

                String s1="this is string";       //string

                String s2="another string";

                String s3=s1.concat(s2);            //concat string

                System.out.println(s3);

                s1=s1.toLowerCase();                //low case my using method

                System.out.println(s1);

                s2=s2.toUpperCase();                  //upper case

                System.out.println(s2);

                System.out.println(s1.equals(s2));         //check string equal or not

                }}
```

Output

```
this is stringanother string
this is string
ANOTHER STRING
false
```
